

Urban Development & uSeed Integration: System Map Analysis

1. Key Stakeholders

The system map identifies several key actors involved in the urban development ecosystem, categorized primarily on the left side of the map:

- **Public Administration:** Includes regional authorities, urban planning entities, the municipality, and local agencies.
- **Organizations:** Local businesses, cultural associations, corporations, and parishes. These groups often prioritize accessibility and inclusion, sometimes over strict profitability.
- **Businesses & Investors:** Small and medium-sized enterprises (SMEs), investment funds, urban developers, and retail businesses.
- **Landowners:** Owners of existing properties, including former industrial owners, real estate funds, owners of former railway zones, and private property owners.

- **Residents:** The people living in the area, including migrants, students, commuters, and families.
-

2. Negative Dynamics & Bottlenecks

Without intervention, the urban area is subject to several negative feedback loops that drive stagnation and decay:

- **Bureaucratic Friction:** The desire to reuse abandoned spaces generates ideas, but these are blocked by numerous regulations. This causes implementation delays, leading to further abandonment and stagnation. While stagnation breeds new ideas, they are continually blocked by the same bureaucratic friction.
 - **Passive Speculation:** Driven by public administration and regulations, owners often feel it is not a convenient time to invest and choose to wait for better conditions ("owner waiting"). This inactivity decreases future property value and increases the tolerance for decay among residents, leading back to more inactivity.
 - **Urban Decay Spiral:** High vacancy rates lead to increased physical decay. This decay breeds social stigma, which in turn causes more vacancies, creating a self-feeding downward spiral.
 - **Social Maintenance Loop:** Urban decay leads to a decrease in community care. This reduces social participation, which ultimately results in even more decay.
 - **Situational Intervention (Risk of Exclusion):** When public administration makes localized improvements, it can raise property values and rent prices. This disproportionately impacts vulnerable populations like students and migrants, potentially leading to gentrification and social exclusion.
-

3. The Solution: uSeed Positive Loops

The **uSeed platform** introduces positive, disruptive loops (mapped on the right) that break the negative spirals and foster urban regeneration:

- **Local Social Activation (Transition Loop):** Facilitating the reuse of spaces builds trust. Greater trust leads to more participation and new community activations, driving common action that results in even more reuse.
- **uSeed Shared Values:** This loop breaks the *Bureaucratic Friction* cycle. Often, public administration misinterprets resident wishes. uSeed enables "Idea Collection" and "Collective Approval." When ideas are collectively approved on the platform, it encourages targeted urban action by authorities, boosting participation and generating even more localized ideas.
- **uSeed Safety Perception:** This interrupts both the *Urban Decay Spiral* and the *Social Maintenance Loop*. By improving the perception of safety, the platform encourages more local events and social interactions, feeding directly into the community's shared values.
- **uSeed Networking:** Collective approval on the platform fosters local networking. This

connects public organizations and supports community action. Better networking leads to more job opportunities, helping retain young people in the area. Because younger demographics are less likely to tolerate decay, this actively diminishes the *Passive Speculation* loop.

- **uSeed Trust:** Focuses on building faith in the platform, public entities, and local organizations. Collective approval leads to better data collection and, consequently, better policies from public entities. This boosts institutional credibility, which increases overall trust, leading to more platform usage and a continuous cycle of improved policymaking.
